ABSTRACT

The present study is to find out the difference in level of social maturity of ADHD and learning disabled children. The sample consist of 60 out of which 30 are ADHD children and 30 are learning disabled children. For this purpose of investigation “Vineland Social Maturity Scale” (Indian Adaptation) by Dr. J. Bharath Raj (1992) was used. The obtained data were analyzed through “t” test to know the mean difference between ADHD and learning disabled children. the result show that There is no significant difference between ADHD and learning disabled children of social maturity. There is no significant difference between mild ADHD and mild learning disabled children of social maturity. There is significant difference between moderate ADHD and moderate learning disabled children of social maturity. There is significant difference between severe ADHD and severe learning disabled children of social maturity.
